**1.0 INTRODUCTION**

**1.1 Purpose**

Delta Consultants (Delta), on behalf of SPX Corporation (SPX), is pleased to present this *Risk-based Remediation Plan for PCB-Contaminated Concrete* for management of polychlorinated biphenyl (PCB)-contaminated concrete at the SPX Lindberg facility located at 304 Hart Street in Watertown, Wisconsin (**Figure 1**). The purpose of this report is to fulfill the application requirements of the Environmental Protection Agency (EPA) Toxic Substance Control Act (TSCA) PCB regulations, 40 CFR 761.61(c) *Risk-based disposal approval* for PCB remediation waste. This report presents the following:

- Site characterization data collected to date;
- Proposed cleanup plan for the facility; and
- Plan for future management of the PCB-contaminated soil and concrete.

Since the proposed cleanup plan includes off-site disposal of PCB remediation waste, engineered controls, and a deed restriction to limit exposure, this Risk-based Remediation Plan is being submitted with the goal of allowing PCB remediation waste to remain at the facility at a concentration of 10 milligrams per kilogram (mg/kg) PCBs.

**1.2 Background Information**

The SPX Lindberg facility is located 1,000 feet east of the Rock River and immediately south of the Chicago, Milwaukee, St. Paul and Pacific railroad in Watertown, Jefferson County, Wisconsin (**Figure 1**). The subject property consists of approximately 5.3 acres of land that is occupied by an approximately 174,000 square foot manufacturing and office building. The Subject Property is bordered by a storage warehouse and railroad tracks to the north, a JohnsonDiversey (formerly U.S. Chemical Company) facility to the east, Hart Street and a parking lot to the south, and residential buildings to the west.

The subject property was originally developed in the early 1920s as a woodworking/manufacturing facility. The majority of the current building infrastructure was constructed in the 1950s, when it was occupied by Hevi-Duty Electric Company, a manufacturer of electrical transformers, heat treating furnaces, and hot plates. According to historical documents, the combined operations of transformer and furnace manufacturing were moved to Watertown, Wisconsin in 1953. In 1962, a limited portion of the Watertown facility produced the larger transformers with a maximum rating of 2000 KVA. All transformer production at the facility ended in 1971.

According to Mr. Jeff Raabe, former manufacturing supervisor at the facility and facility employee since 1973, recent operations consisted of the manufacture of a wide array of industrial ovens, refrigeration units, environmental test chambers, industrial manufacturing furnaces, and custom products. Manufacturing operations were terminated at the facility in late 2005. The facility is currently unoccupied and largely vacant and is being placed on the market for sale. The potential future facility use is anticipated to remain industrial.

No PCB releases have been reported or are known to have occurred within the facility. The presence of PCB-contaminated concrete was discovered during routine Phase II Environmental Assessment (EA) activities performed on October 1, 2009, prior to SPX placing the facility up for sale. Sampling activities were performed to evaluate for the potential presence of PCBs on the concrete floor surface. Surface wipe sampling was performed in an approximate 60-foot square-based grid pattern throughout the facility. Of the 49 surface wipe samples collected during the initial testing, five samples indicated PCB concentrations greater than 10 micrograms ( $\mu\text{g}$ ) per 100 square centimeters ( $\text{cm}^2$ ) total PCBs.

## **2.0 NATURE OF CONTAMINATION**

Between October 2009 and May 2010, Delta has performed six PCB delineation events at the SPX Lindberg facility to assess the extent and magnitude of PCBs on top of and within the concrete floor. These sampling events included both PCB wipe and bulk concrete sampling and occurred on October 1, October 27, and December 28-30, 2009 and January 25-28, March 16-April 2, and May 4-11, 2010. Photographs taken during the sampling events are presented in **Appendix A**.

## **2.1 PCB Wipe Sampling**

In order to initially characterize the horizontal extent of PCBs on the concrete floor surface, a PCB wipe sampling program was performed. A total of 72 wipe samples were collected from the floor in an approximate 60-foot square-based grid pattern throughout the facility. The sample locations are shown on **Figure 2**. No floor coverings were compromised during sample collection; sample locations which were proposed in areas covered with carpeting were moved to the nearest non-carpeted area.

The wipe samples were collected using hexane-preserved sorbent pads provided by Pace Analytical Services, Inc. (Pace). The procedure for obtaining a wipe sample for PCB analysis consisted of rubbing the hexane-soaked pad within a 10 cm by 10 cm ( $100 \text{ cm}^2$ ) sample area, using a prescribed wiping pattern that followed the horizontal and vertical axes of the area. The pad was then placed into a 4-ounce amber glass container and the cover was secured tightly on the jar. The wipe samples were submitted to Pace for analysis for PCBs by EPA Method 8082. Laboratory analytical reports for the wipe samples are presented in **Appendix B**.

Analytical results for surface wipe samples are summarized on **Table 1** and **Figure 2**. PCB concentrations ranged from less than the laboratory reporting limit of 1.0  $\mu\text{g}$  per  $100 \text{ cm}^2$  to 59.7  $\mu\text{g}/100 \text{ cm}^2$ . The PCB concentrations were compared against the TSCA PCB surface cleanup standard of 10  $\mu\text{g}/100 \text{ cm}^2$ . Twenty-six of the wipe samples did not indicate the presence of PCBs. Thirty-six wipe samples contained PCBs at concentrations between 1 and 10  $\mu\text{g}/100 \text{ cm}^2$ . (Ten wipe samples indicated PCB concentrations greater than 10  $\mu\text{g}/100 \text{ cm}^2$ . These samples included:

- B1 (59.7  $\mu\text{g}/100 \text{ cm}^2$ ) and W3 (13.0  $\mu\text{g}/100 \text{ cm}^2$ ), located near the northeast corner of the "Big Bay" area in the vicinity of a loading area;
- W5 (11.7  $\mu\text{g}/100 \text{ cm}^2$ ), B4 (23.7  $\mu\text{g}/100 \text{ cm}^2$ ), W9 (14.4  $\mu\text{g}/100 \text{ cm}^2$ ), B6 (23.2  $\mu\text{g}/100 \text{ cm}^2$ ), and W10 (10.8  $\mu\text{g}/100 \text{ cm}^2$ ), located along the "Heavy Assembly Materials" storage corridor;
- B7 (11.5  $\mu\text{g}/100 \text{ cm}^2$ ) and W33 (12.4  $\mu\text{g}/100 \text{ cm}^2$ ), located south of the "Heavy Assembly Materials" storage corridor near the old shipping office; and
- A8 (10.4  $\mu\text{g}/100 \text{ cm}^2$ ), located in a loading dock area near the southwest corner of the facility.

According to Mr. Raabe, the "Heavy Assembly Materials" area, an approximately 16-foot wide by 315-foot room located in the west-central portion of the facility, was formerly used

as a staging area for parts and equipment prior to being moved into the product assembly rooms.

## **2.2 PCB Bulk Concrete Sampling**

In order to evaluate whether PCBs have penetrated the concrete floor, 585 bulk concrete samples were collected from 406 locations throughout the facility. The locations of these samples are shown on **Figure 3**.

- Concrete samples B1, B4, B6, B7, and A8 were collected at five locations previously sampled using PCB wipe sampling techniques and exhibiting PCB concentrations exceeding the surface standard of 10 µg/100 cm<sup>2</sup> PCBs.
- Concrete samples 1 through 36 were collected within three areas (the northwest loading area, the southwest loading dock, and the "Heavy Assembly Materials" corridor) previously sampled using PCB wipe sampling techniques and exhibiting PCB concentrations exceeding the surface standard of 10 µg/100 cm<sup>2</sup> PCBs.
- Concrete samples 37 through 171 were collected at approximately 10-foot intervals to expand on the areas where PCB impacted concrete was previously identified at concentrations greater than the bulk concrete standard of 1 mg/kg PCBs.
- Concrete samples 172 through 273 were collected at approximately 20-foot intervals to expand on the areas where PCB impacted concrete was previously identified at concentrations greater than the bulk concrete standard of 1 mg/kg PCBs.
- Concrete samples 274 through 401 were collected at approximately 20-foot intervals throughout the remaining manufacturing portions of the facility.

All manufacturing areas of the facility were sampled with the exception of an 11,000-square foot room in the eastern side and a 1,600-square foot room on the northern side. According to Mr. Raabe, the room on the eastern side was constructed circa 1978, which was after the date that transformer production ended at the facility (1971), and was used for oven assembly. The room to the north was added in the early 1990s and was used as a cutting room.

Bulk concrete samples were collected in general accordance with EPA Region 1 *Standard Operating Procedure for Sampling Concrete in the Field* (December 30, 1997). The sample holes were advanced using a hand-held rotary hammer/impact drill equipped with 1-inch and ½-inch masonry bits. The 0-1 inch sample was collected by advancing a hole into the concrete to a depth of one inch using the 1-inch bit. Concrete dust generated from the

drilling of the sample interval was collected using clean disposable sampling tools and placed into a sample jar. The drill hole was vacuumed thoroughly to prevent cross-contamination between sampling intervals. The hole was further advanced to a depth of either 3 (or 4) inches using the ½-inch bit and the concrete dust was collected for the 1-3 (or 2-4) inch sample. The drill bits were decontaminated between holes using a soap and water solution and potable water rinse. Three to four holes were advanced at each sample location to obtain a sufficient sample weight for analysis. The bulk concrete samples were submitted for laboratory analysis for PCBs by EPA Method 8082. Laboratories utilized throughout this project include Pace Analytical Services (Minneapolis, Minnesota), TestAmerica (Watertown, Wisconsin), and New Age/Landmark Mobile Analytical Services (New Haven, Michigan). Laboratory analytical reports for the bulk concrete samples are presented in **Appendix C**.

Analytical results for the bulk concrete samples are summarized on **Table 2** and **Figures 4 and 5**. PCBs were detected throughout the manufacturing portion of the facility. PCB concentrations in the bulk concrete samples ranged from below the detection limit to 3,310 mg/kg.

The bulk concrete sample PCB concentrations were compared against the EPA cleanup level of 1 mg/kg PCBs for bulk remediation waste in high occupancy (an average of 6.7 hours or more a week) areas. Of the 406 near-surface (0 to 1 inch deep) concrete samples collected, 294 samples exhibited PCB concentrations above 1 mg/kg PCBs. Deeper samples (1 to 3 inches deep or 2 to 4 inches deep) were collected from 177 of these locations. PCB concentrations were observed to decrease with depth at 176 of the 177 locations, with only 19 of the deeper samples exhibiting PCB concentrations above 1 mg/kg PCBs.

Two locations which exhibited PCB concentrations above 1 mg/kg PCBs at a depth of 1 to 3 inches were sampled from a depth of 3 to 6 inches. Concrete 31, located in the northwest loading area, contained 3,310 mg/kg PCBs in the 0 to 1 inch deep sample and 1,440 mg/kg in the 1 to 3 inch deep sample. No PCBs were detected in the bulk concrete sample collected at a depth of 3 to 6 inches (reporting limit of 0.1 mg/kg for each Aroclor). Concrete sample B6, located near the center of the "Heavy Assembly Materials" area, contained 7.53 mg/kg PCBs in the 0 to 1 inch deep sample and 2.49 mg/kg in the 1 to 3 inch deep sample. No PCBs were detected in the bulk concrete sample collected at a depth of 3 to 6 inches (reporting limit of 0.1 mg/kg for each Aroclor).

Bulk concrete samples were collected from 3 areas located on the outside of the facility: the loading ramp near the southwest corner; the truck ramp located on the east side; and the rail spur loading area on the north side. Four of the six samples collected from the rail spur loading area (Concrete 36, 39, 40, and 41) contained PCBs at concentrations exceeding 1 mg/kg PCBs. None of the samples collected from the other two areas contained PCBs at concentrations above 1 mg/kg PCBs.

### **3.0 CLEANUP PLAN**

The SPX Lindberg facility is a manufacturing and office building. PCB-contaminated concrete is present throughout the manufacturing portion of the facility. Should a self-implementing cleanup be conducted, a cleanup level for bulk PCB remediation waste of  $\leq 1$  mg/kg would be required without further conditions per 40 CFR 761.61(a)(4)(i)(A). (However, an alternative, risk-based cleanup level may be used, pending EPA approval, in accordance with 40 CFR 761.61(c). Based on preliminary conversations with personnel from EPA Region 5 and the Wisconsin Department of Natural Resources (WDNR), a risk-based cleanup level of  $\leq 10$  mg/kg PCBs may be an acceptable site-specific cleanup level for this facility.)

A quantitative human health or environmental risk assessment has not been conducted. With the exception of the concrete pad in the rail spur loading area, the PCB contamination is located within the confines of the facility building. Vertical bulk concrete sampling results demonstrate that the PCBs have not penetrated the concrete floor to the underlying soil. Since the contaminated areas which will remain at the property following the proposed cleanup are confined within the physical enclosure of the building, no associated risks to the environment are anticipated. Access to the contaminated areas is provided by entrance doors which are currently locked. Under potential future use conditions, the anticipated use of the building is industrial. The potential occupational exposure in this scenario stems primarily from dermal contact with the contaminated floor.

The proposed site cleanup presented below includes off-site disposal, engineered controls, and a deed restriction to limit exposure. Based on its industrial use and limited accessibility, a risk-based cleanup level of  $\leq 10$  mg/kg is being requested for this facility. Approximately 20,650 square feet of concrete contains PCBs at concentrations greater than 10 mg/kg (**Figure 6**).

>10 mg/kg  
WAC (Leave in place)

The following remediation methods are proposed for the facility in order to address the PCBs at concentrations greater than 10 mg/kg:

- Bulk PCB Remediation Waste removal and off-site disposal of the 700 square-foot concrete pad in the rail spur loading area.
- Continued Use Authorization, which includes cleaning per Subpart S and two coats of epoxy, for the in-place management of 12,150 square feet of PCB-contaminated, bare concrete flooring.
- Continued Use Authorization, which includes superficial cleaning and two coats of epoxy, for the in-place management of 7,000 square feet of PCB-contaminated, epoxy-coated concrete flooring.
- Cleaning per Subpart S for the in-place management of approximately 800 square-feet of PCB-contaminated concrete flooring located at 8 non-contiguous locations.

Mode of Disposal needed. P.644

The locations within the facility proposed to be cleaned by these remediation methods are shown in **Figure 7**.

### **3.1 Bulk PCB Remediation Waste Removal and Disposal**

A 16-foot by 43-foot concrete pad located in the rail spur loading area to the north of the facility building was found to contain PCBs at concentrations greater than 10 mg/kg (**Figure 7; Appendix A, Photograph 1**). A bulk concrete sample collected from Concrete 36 contained 201 mg/kg PCBs in the 0 to 1 inch sample interval. In order to manage the PCBs in this area, SPX will remove the entire concrete pad in accordance with 40 CFR 761.61(a)(5)(i). The bulk PCB remediation wastes will be managed and disposed off-site according to the applicable waste classification and disposal regulations as specified under 40 CFR 761.61(a)(5)(i)(B)(2).

Following removal of the concrete pad, a confirmation sample will be collected from the soil beneath the location of Concrete 36. This sample will be analyzed for PCBs by EPA Method 8082. A bulk concrete sample previously collected from Concrete 36 contained 2.29 mg/kg PCBs in the 1 to 3 inch sample interval. Bulk concrete samples collected from the other five locations in the concrete pad did not detect the presence of PCBs at a depth of 1 to 3 inches, so no additional confirmation sampling will be performed beneath the concrete pad.

### **3.2 Continued Use Authorization**

The 40 CFR 761.30(p) *continued use of porous surfaces contaminated with PCBs regulated for disposal by spills of liquid PCBs* authorization will be implemented for the in-place management of 19,150 square feet of PCB-contaminated concrete located within the facility. The proposed cleanup level for the work described in this section is  $\leq 10$  mg/kg PCBs.

The proposed cleanup area has been subdivided into two distinct areas with respect to the surface condition of the concrete. The first area consists of 12,150 square feet of bare concrete flooring stretching from the north end of the facility to approximately 440 feet to the south, including the loading dock located on the west side of the building (**Figure 7; Appendix A, Photographs 2 through 5 and 8**). The second area consists of a 7,000-square foot former assembly area near the southern end of the facility (**Figure 7; Appendix A, Photographs 6 and 7**). The floor in this area is covered with a white epoxy coating.

#### **3.2.1 PCB Source Control**

The first step of implementing the 761.30(p) continued use authorization requires the removal of the source causing the release of PCBs. No PCB releases have been reported or are known to have occurred within the facility. The results of the investigation discussed above do not indicate a point source of the PCB contamination. (The results of a Phase I Environmental Site Assessment (EA) performed at the facility indicated the potential historical presence of PCBs related to the former manufacture of electrical transformers at the facility. According to information presented in the EA report, dated September 23, 2009:

*The second suspect REC consists of the former manufacture of electric transformers at the Subject Property by the Hevi-Duty Company in the 1950's. Historically, manufacturers of transformers were known to employ dielectric fluids containing polychlorinated biphenyls (PCBs). This condition is characterized as a suspect REC since no direct evidence in the form of spills or releases of transformer fluids are known, nor have any indications of the use of PCB-containing fluids been directly identified at the Subject Property. However, the manufacturing of electric transformers at the Subject Property is indicated in a 1956 Sanborn map and the Hevi-Duty Company is known to have historically used PCB containing transformer fluids at other facility locations in the United States.*

Information regarding Hevi-Duty Company historical operations was obtained from the SolaHD website (<http://www.solaheviduty.com>). According to the company's historical summary, the combined operations of transformer and furnace manufacturing were moved

to Watertown, Wisconsin in 1953. In 1962, a limited portion of the Watertown facility produced the larger transformers with a maximum rating of 2000 KVA. All transformer production at the facility ended in 1971.

### **3.2.2 Decontamination and Coating Methods**

Prior to the initiation of cleanup activities at the facility, all moveable equipment and materials will be removed from the areas to be cleaned. The 12,150 square feet of bare, PCB-contaminated concrete floor will be cleaned in accordance with the double wash/rinse procedure described in 40 CFR 761 Subpart S. This procedure is intended for the decontamination of non-porous surfaces, but 761.30(p) requires that this method be used to prepare PCB-contaminated concrete for encapsulation. Following an initial vacuum to remove loose dust and bird waste, the surface washing steps in this area will include 1) high-pressure steam wash with concrete cleaner/degreaser, 2) potable water rinse, 3) power scrub with a cleaning/degreasing and muriatic acid etchant solution, and 4) high-pressure steam rinse.

*Review*

The 7,000 square feet of epoxy-coated, PCB-contaminated concrete floors will be cleaned in a manner less stringent than the double wash/rinse procedure. The reason for this is that while bulk concrete samples collected from below the epoxy-coated surface in this area contained elevated levels of PCBs, wipe samples taken from the top of the epoxy-coated surface did not exhibit PCBs above  $10 \mu\text{g}/100 \text{ cm}^2$ . Following an initial vacuum to remove loose dust and bird waste, the surface washing steps in this area will include a 1) high-pressure steam wash with concrete cleaner/degreaser, 2) a light scuffing of the epoxy-coated surface with 100+ grit sandpaper, and 3) a final vacuum and rinse.

Following the surface washing activities and once the surface has been allowed to dry for a minimum of 24 hours, an epoxy encapsulant will be placed on the concrete surface according to the requirements of 40 CFR 761.30(p)(1)(iii)(A). Two coats of epoxy will be applied to the floor surface. The two coats of epoxy will consist of contrasting colors so that any wearing of the topcoat can be detected. In the area where a white epoxy coating already exists, one additional coat will be applied in a contrasting color.

Once the epoxy has dried, labels will be placed on the encapsulated floor surfaces to indicate that PCBs remain in the underlying concrete as specified under 40 CFR

761.30(p)(1)(iii)(B). The labels, described in 761.45, will be applied at the entrances, corners, and central portions of the encapsulated area.

### **3.2.3 Disposal**

Wastes generated during the double wash/rinse procedure and encapsulation may include water mixed with detergent, water mixed with spent degreaser, used absorbent materials, and other equipment. These wastes will be managed according to applicable waste classification and disposal regulations as specified under 40 CFR 761.378(c). *ckc*

### **3.3 Subpart S Cleaning**

Besides the 19,150 square feet of PCB-contaminated concrete described above, there were eight non-contiguous concrete sample locations exhibiting PCB concentrations greater than 10 mg/kg (**Figure 7**). These locations include the following:

- Concrete 53 - 12.67 mg/kg PCBs at 0-1 inch, 1.06 mg/kg PCBs at 1-3 inches (Wipe B5 had 2.0 µg/100 cm<sup>2</sup> PCBs),
- Concrete 103 - 40.0 mg/kg PCBs at 0-1 inch, non-detect at 1-3 inches,
- Concrete 178 - 11.00 mg/kg PCBs at 0-1 inch (Wipe A7 had 4.6 µg/100 cm<sup>2</sup> PCBs),
- Concrete 230 - 11.50 mg/kg PCBs at 0-1 inch, non-detect at 2-4 inches (Wipe C3 had 5.6 µg/100 cm<sup>2</sup> PCBs),
- Concrete 239 - 22.0 mg/kg PCBs at 0-1 inch, (Wipe C6 was non-detect),
- Concrete 252 - 11.0 mg/kg PCBs at 0-1 inch, non-detect at 2-4 inches,
- Concrete 272 - 10.3 mg/kg PCBs at 0-1 inch, non-detect at 2-4 inches (Wipe C4 had 4.5 µg/100 cm<sup>2</sup>), and
- Concrete 370 - 16.0 mg/kg PCBs at 0-1 inch.

Given the limited areal and vertical extent of PCBs in these eight locations, the Subpart S double wash/rinse procedure will be used to decontaminate the shallow concrete. A 10-foot by 10-foot (100-square foot) area surrounding each sample location will be cleaned using the method for bare floors as described in **Section 3.2.2**. Following the surface washing activities, confirmation bulk concrete samples will be collected from 0 to 1 inch in each of these areas and analyzed for PCBs by EPA Method 8082. Should the sample result indicate a PCB concentration of ≤10 mg/kg, the cleanup will be considered complete. If the sample result should indicate a PCB concentration greater than 10 mg/kg PCBs, an epoxy encapsulant will be placed on the 100 square-foot area as described in **Section 3.2.2**.

### **3.4 Schedule**

It is anticipated that the cleanup will begin within approximately one month of EPA authorization and will take approximately one month to complete. The following is an estimated timeline to complete the site cleanup:

<b>Item</b>	<b>Date</b>
EPA Approval	October 2010
Initiate Site Cleanup	November 2010
Complete Site Cleanup	December 2010
Reporting and Deed Restriction Filing	February 2011

### **4.0 RECORDKEEPING**

As requested in 40 CFR 761.61(a)(3)(i)(E), a file containing all sampling plans, sample collection procedures, sample preparation procedures, extraction procedures, and instrumental/chemical analysis procedures used to assess the PCB contamination at the facility will be maintained at the facility and will be available for EPA inspection. The written certification, signed by a representative of SPX as both property owner and party conducting the cleanup, will be submitted as a separate document.

Because cleanup activities include the use of an encapsulant and PCB-contaminated concrete will remain at concentrations which exceed the regulatory cleanup levels, a deed restriction will be recorded within 60 days of the completion of the cleanup activities in accordance with 40 CFR 761.61(a)(8)(i). (A written certification indicating that the deed restriction has been filed will be submitted to the EPA Regional Manager.)

NOTE 11

Long-term management of the PCB-affected concrete will be necessary. An operations and maintenance management plan will be developed to maximize employee protection. Components of the management plan will include training information for facility workers to inspect the encapsulant for wear and damage, procedures for repairing the encapsulant as needed, and a safety plan for workers in the event that they need to penetrate the encapsulant and drill into the concrete. The management plan will also include a plan for addressing the ultimate removal and disposal of PCB-contaminated concrete and soil remaining beneath the encapsulant for the point in time when the property is adapted for another use or the building demolished.

### **5.0 REMARKS**

The recommendations contained in this report represent Delta's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. This report is based upon a specific scope of work requested by the client. The contract between Delta and its client, SPX Corporation, outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Delta's client and anyone else specifically identified in writing as a user this report. Delta will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Delta makes no express or implied warranty as to the contents of this report.

RE: Project: SPX LINDBERG 9M0909245  
Pace Project No.: 10113975

Dear Ms. Thole:

Enclosed are the analytical results for sample(s) received by the laboratory on October 03, 2009. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

*Carolynne Trout*

## REPORT OF LABORATORY ANALYSIS

Page 59 of 60

This report shall not be reproduced, except in full,  
without the written consent of Pace Analytical Services, Inc..

## QUALIFIERS

Project: SPX LINDBERG 9M0909245

Pace Project No.: 10113975

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

U - Indicates the compound was analyzed for, but not detected.

### BATCH QUALIFIERS

Batch: GCSV/6068

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: GCSV/6069

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: GCSV/6077

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

RE: Project: 9M0909245 SPX LINDBERG  
Pace Project No.: 10115796

Dear Ms. Thole:

Enclosed are the analytical results for sample(s) received by the laboratory on October 29, 2009. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

*Carolynne Trout*

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

U - Indicates the compound was analyzed for, but not detected.

### BATCH QUALIFIERS

Batch: GCSV/6149

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

RE: Project: 9M0909245 SPX Lindberg  
Pace Project No.: 10115807

Dear Ms. Thole:

Enclosed are the analytical results for sample(s) received by the laboratory on October 29, 2009. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

*Carolynne Trout*

## QUALIFIERS

Project: 9M0909245 SPX Lindberg

Pace Project No.: 10115807

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

U - Indicates the compound was analyzed for, but not detected.

### BATCH QUALIFIERS

Batch: GCSV/6147

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

Batch: GCSV/6177

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

RE: Project: 9M0909245 SPX Lindberg  
Pace Project No.: 10115805

Dear Ms. Thole:

Enclosed are the analytical results for sample(s) received by the laboratory on October 29, 2009. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

*Carolynne Trout*

## QUALIFIERS

Project: 9M0909245 SPX Lindberg

Pace Project No.: 10115805

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

L - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

U - Indicates the compound was analyzed for, but not detected.

### ANALYTE QUALIFIERS

- |    |  |
|----|--|
| CL | The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased low. |
| D3 | Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.                   |
| M3 | Matrix spike recovery was outside laboratory control limits due to matrix interferences.                                     |
| S4 | Surrogate recovery not evaluated against control limits due to sample dilution.  |
